Title : The profile of tuberculosis medication prescription in adult patient at the Puskesmas Kecamatan Pasar Minggu in the Period of January to December 2019.

Tuberculosis is a disease caused by *Mycobacterium tuberculosis* and can be present in both latent and active forms. Most TB bacteria attack the lungs, but it can also affect other organs. This study was conducted to determine the profile of tuberculosis medication prescription in adult patient at the Puskesmas Kecamatan Pasar Minggu in the Period of January to December 2019. This type of research is non-experimental with retrospective data collection and descriptive data analysis. In this study there were 90 research subjects with the number and percentage of male sex patients as many as 61 people (67.78%) women as many as 29 people (32.22%). The age of most patients in the age group 36-45 years is 35 people (38.89%). In the initial sputum examination there were 90 patients with positive results (100%) while the highest sputum examination of TB patients was negative examination with 75 patients (83.33%). The most widely used antituberculosis drug is first category as many as 84 people (93.33%). Patients with new cases were 84 patients (93.33%). The highest dose and frequency were found using first category, used 3 tablets of 4 KDT with a frequency of 1x1 / day, as many as 50 patients (55.56%). TB treatment for exactly 6 months was 74 patients (82.22%). The final outcome of treatment of pulmonary tuberculosis patients is recovering 75 patients (83.33%).

Keywords: antituberculosis drug, Pulmonary Tuberculosis, Puskesmas Pasar Minggu.
