Program Studi : 14334018  
Judul : Studi persepan obat antidiabetes oral pasien Lansia di  
Puskesmas Kecamatan Kebayoran Lama, Jakarta Selatan  
Periode Januari 2017-januari 2018

Diabetes mellitus (DM) is a heterogeneous disease whose symptoms are marked by an increase in blood sugar levels (hyperglycemia) caused by a disorder that occurs in insulin secretion, insulin work, or both in the body. information was obtained about the profile of the use of Oral Anti Diabetes medicine (ADO) in the community such as the name of the drug, strength, number and rules of use of the drug in which there is a possibility of the occurrence of drug therapy problems such as drug indications and interactions. Therefore, analyzing research is needed by taking into account the prescribing patterns of the use of oral antidiabetic drugs in elderly patients in the old Kebayoran sub-district health center for the period of January 2017 - January 2018, in this study using a cross-sectional descriptive study, and using the retrospective method. This research was conducted with a sample of 195. The results of using the drug metformin + glibenclamid were more widely used than the administration of a single drug
